

1) Given, $L = [0^n 1^m \mid n \geq 1, m \geq 1, m > n+2]$

2) Required, PDA for $L = \{a^{3n} b^{2n} : n \geq 0, 1, 2, \dots\}$

3) Given, $L = \{a^{2n} : n \geq 0\}$

Now, we can observe that this language is a regular language as there is a ~~Regular~~ DFA associated.

Also Grammar is G :

$$S \rightarrow aaA \mid \lambda$$
$$A \rightarrow aaA \mid \lambda$$

and this is a right linear grammar and therefore regular.

\therefore (i) is True

(ii) is false as we proved it is regular

(iii) is false as all regular languages are context free
